## THEOREM OF THE DAY

| 1 2 1 <br> 1   |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | [3 |  | 1 |  |  | The fact that $p$ divides $\binom{2 p-1}{p-1}-1$ for any prime $p$ can be deduced easily from the remarkable theor |  |  |  |  |  |  |  |  |  |
| 1 | 4 | 6 | 4 | 1 |  |  | is congruent, mod $p$, to the product $\Pi\binom{n_{i}}{k_{i}}$, where the $n_{i}$ and $k_{i}$ are matching pairs of digits in |  |  |  |  |  |  |  |  |
| 1 | 5 | 10 | 10 | 5 | 1 |  | and $k$. Indeed, $\binom{n}{k} \equiv\binom{p n}{p k}$ mod $p$, since multiplying by $p$ merely contributes an extra |  |  |  |  |  |  |  |  |
| 1 | 6 | 15 | 20 | 15 | 6 | 1 |  |  |  |  |  |  |  |  |  |
| 1 | 7 | 21 | 35 | 35 | 21 | 7 | Now take $n=2$ and $k=1$, giving $\binom{2}{1} \equiv\binom{2 p}{p} \bmod p$, or $2 \equiv 2\binom{2 p-1}{p-1} \bmod$ |  |  |  |  |  |  |  |  |
| 1 | 8 | 28 | 56 | 70 | 56 | 28 | 8 | 1 |  | that, for odd primes $p,\binom{n}{k} \equiv\binom{p n}{p k} \bmod p^{2}$. And indeed we can |  |  |  |  |  |
| 1 | 9 | 36 | 84 | 126 | 126 | 84 | 36 | 9 | 1 | for primes $p \geq 5$. For example, taking $n=4$, |  |  |  |  |  |
| 1 | 10 | 45 | 120 | 210 | 252 | 210 | 120 | 45 | 10 | 1 | that $4=\binom{4}{3} \equiv\binom{20}{15}=15504(\bmod 125)$ |  |  |  |  |
| 1 | 11 | 55 | 165 | 330 | 462 | 462 | 330 | 165 | 55 | 11 | 1 |  | 3 |  |  |
| 1 | 12 | 66 | 220 | 495 | 792 | 924 | 792 | 495 | 220 | 66 | 12 | 1 | (the circled fig |  |  |
| 1 | 13 | 78 | 286 | 715 | 1287 | 1716 | 1716 | 1287 | 715 | 286 | 78 | 13 | 1 |  |  |
| 1 | 14 | 41 | 364 | 1001 | 2002 | 3003 | 3432 | 3003 | 2002 | 1001 | 364 | 91 | 14 | 1 |  |
| 1 | 15 | 105 | 455 | 1365 | 3003 | 5005 | 6435 | 6435 | 5005 | 3003 | 1365 | 455 | 105 | 15 | 1 |
| 1 | 16 | 120 | 560 | 1820 | 4368 | 8008 | 11440 | 12870 | 11440 | 8008 | 4368 | 1820 | 560 | 120 | 16 |
| 1 | 17 | 136 | 680 | 2380 | 6188 | 12376 | 19448 | 24310 | 24310 | 19448 | 12376 | 6188 | 2380 | 680 | 136 |
| 1 | 18 | 153 | 816 | 3060 | 8568 | 18564 | 31824 | 43758 | 48620 | 43758 | 31824 | 18564 | 8568 | 3060 | 816 |
| 1 | 19 | 171 | 969 | 3876 | 11628 | 27132 | 50388 | 75582 | 92378 | 92378 | 75582 | 50388 | 27132 | 11628 | 3876 |
| 1 | 20 | 190 | 1140 | 4845 | 15504 | 38760 | 77520 | 125970 | 167960 | 184756 | 167960 | 125970 | 77520 |  | 15504 |
| 1 | 21 | 210 | 1330 | 5985 | 20349 | 54264 | 116280 | 203490 | 293930 | 352716 | 352716 | 293930 | 203490 | 16280 | 54264 |

| 1 | 24 | 276 | 2024 | 10626 | 42504 | 134596 | 346104 | 735471 | 1307504 | 1961256 | 2496144 | 2704156 | 2496144 | 1961256 | 1307504 |
| 1 | 25 | 300 | 2300 | 12650 | 53130 | 177100 | 480700 | 1081575 | 2042975 | 3268760 | 4457400 | 5200300 | 5200300 | 4457400 | 3268760 | for which $\binom{2 p-1}{p-1} \equiv 1 \bmod p^{4}$ holds are 16843 and 2124679 (the first two so-called Wolstenholme primes).

Moving deeper into number theory, let $H_{n, m}$ denote the sum $1+1 / 2^{m}+1 / 3^{m}+\ldots+1 / n^{m}$. Then $\frac{1}{2}\left(H_{p-1,1}^{2}-H_{p-1,2}\right)$ is the coefficient of $p^{2}$ in the product $\left(1+\frac{p}{1}\right)\left(1+\frac{p}{2}\right) \cdots\left(1+\frac{p}{p-1}\right)$ and so $\binom{2 p-1}{p-1}=\prod_{k=1}^{p-1}\left(1+\frac{p}{k}\right)$ is given $\bmod p^{3}$ by the sum $1+p H_{p-1,1}+\frac{1}{2} p^{2}\left(H_{p-1,1}^{2}-H_{p-1,2}\right)$. Now, it may be established that $H_{p-1,1} \equiv 0 \bmod p^{2}$ (i.e. numerator of $H_{p-1,1}$ is divisible by $p^{2}$ ), and $H_{p-1,2} \equiv 0 \bmod p$. Substituting into our $\bmod p^{3}$ sum, taking a little care that the fractions behave as they should, this is enough to confirm that $p^{3}$ divides $\binom{2 p-1}{p-1}-1$.

Charles Babbage proved in 1819 that $p^{2}$ divides $\binom{2 p-1}{p-1}-1$. Joseph Wolstenholme's congruences, both the binomial and the more influential $H_{m, n}$ 'harmonic series' forms, date from 1862.
